Engineer

TITLE: Model blades of plastic grade ACT-T (AST-T)

PERIODICAL: Energomashinostroyeniye, no.8, 1962, 26-27

TEXT: In 1959, the KhtGZ in Kirova commenced making blades for turbine models of acrylic plastic grade AST-T (the initials denote acrylic, self-hardening, technical) for which the ratio of ultimate tensile strength to specific gravity equals  $605 \times 10^3$  kgm/kg. The ultimate strength (kg/cm<sup>2</sup>) is: in tension 600 to 800; in bending 800 to 1200; in shear 460.. The impact strength, kgm/cm<sup>2</sup> equals 0.12 and the specific gravity 1.16 to 1.18 g/cm<sup>3</sup>. The operating temperature is up to 60°C. The pattern blade is made of steel, duralumin or brass, the press mould of Woods metal. A 3:1 mixture of plastic polymer powder and fluid is pressed at 35 to 40°C for 10 min. One mould can make 100 blades. The scatter of blade thickness did not exceed 0.04 to 0.06 mm. The blade surfaces were polished after moulding. One of several examples mentioned is a compressor runner 200 mm  
Card 1/2

Model blades of plastic ...

E194/E455

diameter; the T-shaped roots of the plastic blades were secured in the slots with carbonyl adhesive. In overspeed tests the blades failed at 16000 rpm which corresponds to calculations. The blades ran for a total of four hours with a maximum peripheral speed of 168 m/sec. Moisture and dirt in the works compressed-air supply sometimes eroded the leading edges of the blades and in future it is proposed to clean the air. For a model compressor with an external diameter of 250 mm, blades made from plastic are about one tenth of the cost of blades made of steel grade 1X13 (1Kh13) by the usual works methods and cost between a half and a third that of blades cast of aluminium alloys. The saving is due to the simplicity of manufacture rather than the cheaper material. The only practical limitation is that the operating temperature should not exceed 60°C. There are 3 figures.

AUTHOR: Nemtsev, A. V., Engineer

TITLE: <sup>P</sup>Comparing some methods of semi-automatic welding with an open arc of low carbon steel

PERIODICAL: Svarochnoye proizvodstvo, no. 5, 1961, 11 - 13

TEXT: Under the supervision of Academician K.K. Kurenov of AS UkrSSR, the author investigated three methods of semi-automatic welding, i.e., welding in carbon dioxide, welding with magnetic flux feed by a carbon dioxide flow, and welding with a batch of flux and carbon dioxide supplied to the welding area. These methods are economical since special electrode wire is not needed when welding low-carbon steels. All the experiments were made with low-carbon St.3 and St.4 grade steels and 2 mm diameter welding wire. Welding was performed on d-c of reverse polarity, by manual process using semi-automatic adapters. Oscillogramming, filming and determining the effect of welding parameters on the shape of weld joints was made by fastening the adapter to the trolley of the ADC-500 (ADS-500) semi-automatic machine. For welding in carbon dioxide Св-10ГС (Sv-10GS) wire was used, and Св-08А (Sv-08A) wire and ИМФ-20 (IMP-20) magnetic flux for the other methods. The flux was composed by the author. The composition is Card 1/6

Comparing some methods of semi-automatic welding...

given in Table 1. The welding process is mainly characterized by its efficiency. The dependence of coefficients of building up and fusion on the welding current are shown in figures 1 and 2, the dependence of the shape of the weld joint on the current is illustrated in figure 3. The chemical composition of the built-up metal is considerably affected by the arc voltage. At 360 - 400 amp current, best results are obtained at 28 - 32 v (in carbon dioxide) and 34 - 36 v (with magnetic flux). Strength characteristics obtained are given in table 2 and results of checking the toughness of the weld metal are shown in Fig. 5. It was found that highest efficiency and penetration depth were assured by welding with magnetic flux feed by carbon dioxide, producing joints of sufficiently high quality. Welding with magnetic flux is also highly efficient. The method can be recommended for welding low-carbon steels due to the simplicity of the semi-automatic installation and the economical advantages of the process. Welding in carbon dioxide is sufficiently efficient and economical and can be used for welding low-carbon steels due to the satisfactory properties of the built-up metal. There are 2 tables and 5 figures.

AUTHOR: Nantsev, A. V.

TITLE: Semiautomatic welding of steel

PERIODICAL: Avtomaticheskaya svarka, No. 3, 1964

TEXT: The mentioned welding method, designed by A.I. Brodskiy, is analogous with the Brown-Browning method developed in the U. S. under the name of "New Automatic Welding Development" (New Automatic Welding Development, No. 149, no. 4, 1957). The article describes the method of welding of St.4 steel. The properties of the weld metal are compared with the work of steel of the same grade. The properties of the weld metal are good shade, and the slag is easily removed. The chemical composition of the weld metal was determined, and the results of the analysis are given. The composition is the following: 0.4% carbon, 0.02% phosphorus, 0.001% sulfur, 0.0001% nitrogen, 0.0001% oxygen, 0.0001% hydrogen, 0.0001% helium, 0.0001% neon, 0.0001% argon, 0.0001% krypton, 0.0001% xenon, 0.0001% radon.

Semiautomatic welding with magnetic ceramic flux

1) The method is high-productive; 2) IMF-20 flux may be used in combination with the welding wire grades Cб-08 (Sv-08) and Cб-08 (Sv-08A) for welding low-carbon steel (St.3, St.4); 3) Welding with magnetic flux is economical in view of the low flux consumption, and welding is possible in horizontal, vertical and inclined position; 4) The arc is clearly visible, therefore the method is suitable for welding short and figured seams in repair work. There are 4 figures, 3 tables and 5 references: 4 Soviet-bloc and 1 non-Soviet-bloc. The reference to the English-language publication reads as follows: A Review of New Automatic Welding Developments in the USA, "Welding and Metal Fabrication", 149, no. 4, 1955. ✓

**TITLE:** On the Book by V. F. Ivanov and S. V. Nemtsev: "Organization and Planning of the Topographical-Geodetical and Cartographical Production" (O knige V. F. Ivanova i S. V. Nemtseva "Organizatsiya i planirovaniye topografò-geodezicheskogo i kartograficheskogo proizvodstva")

**PERIODICAL:** Geodeziya i Kartografiya, 1958, Nr 1, pp. 75 - 77 (USSR)

**ABSTRACT:** Published at the end of 1957. This book was admitted as a textbook for teaching at the topographical and technical institutes by the division of the schools at the GUGK MVD USSR (Central Office for Geodesy and Cartography in the Ministry of the Interior of USSR). A criticism is practiced here point by point and the faults in the book are pointed out. A thorough revision is recommended for the case of a new edition.

TITLE: Electron properties of thin films of germanium

PERIODICAL: Radiotekhnika i elektronika, Vol. 5, No. 10, 1960,  
pp. 1669-1671

TEXT: This paper was read at the 9th All-Union Conference on Cathode Electronics in Moscow October, 1959.

The aim of the present work was to investigate the electrical conductivity of thin germanium films of various thicknesses and changes in the electrical conductivity due to heat treatment, oxidation, etc. In distinction to previously published work, the present authors state that they have carried out their measurements in "ultra-high vacuum" ( $p \approx 1 \cdot 10^{-8}$  mm Hg). In ordinary vacua one always obtains p-type germanium films (owing to contamination by residual gas), while in ultra-high vacua n-type germanium films can be obtained. In the present experiments n-type germanium films with  $\rho = 26 \cdot 2$  ohm cm were obtained. A special glass envelope was made which was used to measure the resistance of 12-13 films obtained in a single evaporation run. Silver contacts  
Card 1/4

21590

Electron properties of thin films S/109/60/005/010/013/031  
E032/E114

were employed and the thickness of the films was determined by calculation from the geometry and weight of the specimens. Fig.1 shows the logarithm of the resistivity as a function of thickness (microns). In this figure curve 1 refers to a freshly evaporated layer, curve 2 is for a specimen a few days old, curve 3 was obtained after heating at 300 °C for one hour, curve 4 after heating at 450 °C for one hour, and curve 5 after exposure to air. Fig.2 shows dependence of  $1/\rho d$  on  $\log d$  (1 - fresh deposit of Ge; 2 - oxygen atmosphere at  $5 \times 10^{-7}$  mm Hg for 15 min. 3, 4, 5 - further exposure to oxygen). It is seen that a linear relationship is obtained between these two quantities for the freshly deposited film. It is concluded (in accordance with the J.Thomson theory, Ref.4) that freshly deposited germanium films are continuous and uniform right up to 10  $\mu$ m, since the change in the resistivity with thickness can be explained by the scattering of current carriers at the surface. This is confirmed by the fact that heating, oxygenation, etc. lead to a departure from the linear relationship. The mean free path of the current carriers in freshly deposited films of Ge was found to be approximately 100  $\mu$ m, which is in agreement with the value calculated from the mobility. Card 2/4

AUTHORS: Nakhodkin I G and Nemtsev V P

TITLE: A device for the investigation of the electrical properties of thin films as a function of their thickness

PERIODICAL: Pribery i tekhnika eksperimenta 1961 No 4, pp.113-116

TEXT: The device described in the present paper may be used to obtain thin films of metals and semiconductors at a pressure of  $\sim 10^{-9}$  mm Hg, and to measure their electrical conductivity and other parameters. The electrical conductivity may be measured at twelve points corresponding to different thicknesses of the wedge-shaped film. The temperature of the target upon which the variable-thickness film is deposited may be maintained at a constant temperature in the range between the liquid hydrogen temperature and  $\sim 300^{\circ}\text{C}$ . The experimental tube was based on the principle put forward by N. D. Morgulis and S. A. Vekshinskiy (Ref. 2: N. D. Morgulis Dopovidi sichnevoi sesii AN UkrSSR, 1942, 2 215. C. A. Vekshinskiy Novyy metod metallograficheskogo issledovaniya splavov (New Method of Metallographic Investigation

of Alloys) 1944) The substance under investigation is evaporated onto a sectionalized dielectric target with metal contacts. The method has the advantage that the vacuum remains the same throughout the thickness of the deposit can be determined quite easily, and the entire experiment is carried out in a sealed-off tube within which a low residual pressure can be maintained. Fig.1 shows a schematic drawing of the device. The target is made of glass and consists of separate 10 x 4 x 1 mm<sup>3</sup> plates sealed to a glass support so that the "wedge" of the evaporated material is divided into separate parts. Each of the plates carries silver contact wires. The tube is carefully outgassed and evacuated (Alpert gauge, titanium pump, special cooled getter). Provision is made for measuring the contact potential difference relative to a tungsten wire, the thermal e m f (in the case of semiconductors) the sign of the current carriers, etc. The thickness of the film can be calculated as described in Ref. 2 and also determined directly after releasing the vacuum by means of the Linnik interferometer as described in Ref. 4 (M. P. Lisitsa, G. N. Tsvelykh, Zavodsk laboratoriya, 1959, 31, 1072). Fig. 3 shows the logarithm of the

TITLE: Cooling of the Tail Section of Turbines  
Operating With a Lowered Vacuum (Okhlazh-  
deniye khvostovoy chasti turbin, rabota-  
yushchikh s ukhlazhennym vakuumom)

PERIODICAL: Energetik, 1958, Nr 2, p 10-12 (USSR)

ABSTRACT: There are many medium capacity condensation  
turbines which pass to operation with a  
lowered vacuum. In order to decrease the  
dangerously high temperature rise of the  
steam in the turbine's tail section, a new  
system of cooling has been developed by the  
author and a thermoelectric power plant in  
Bashkiriya. The essence of the new system  
consists in injecting condensed water thru  
appropriate holes into the exhaust section.

TITLE: On the Principles of Distribution of Heat (Supply (District Heating) Load in the Conditions of a Modern Power System  
(O printsipakh raspredeleniya teplofikatsionnoy nagruzki v usloviyakh sovremennoy energosistemy)

PERIODICAL: Teploenergetika, 1958, No 2, pp 34-36 (USSR)

ABSTRACT: This is a theoretical article on the rational distribution of heat-supply loads between sets with different initial steam conditions. Previous work on the correct distribution of heat-supply load is based on maximum electric power generation; this basis cannot always be valid in the conditions of a power system. The principle is maintained when the initial steam conditions are the same in sets working in parallel. However, it often happens that medium- and high-pressure sets work in parallel and the high-pressure set is the more efficient. In such cases, the principle of obtaining the maximum quantity of electric power for the given heat load is not always applicable. A sounder principle of load distribution is to obtain the least loss of heat from the turbine condensers. Equations are then derived for the heat balance during the generation of electricity. The formulae that are derived are not applicable to all the cases that are met in practice but cover only the most important

Card 1/2

On the Principles of Distribution of Heat-supply (District Heating)  
Load in the Conditions of a Modern Power System

conditions. It does not follow from the formulae and the calculations that it is always more advantageous to load first the medium-pressure pass-outs of the turbines rather than the high-pressure pass-outs. A number of particular examples are discussed in the article. The examples were selected only with the object of showing the partial applicability of the principle of generating the maximum quantity of electric power for a given thermal load. Therefore, they ignore differences in the internal relative efficiencies of turbine and boilers, differences in vacuums and so on. If these factors are taken into account, it is found that they are decisive in some cases. As a power system develops, it becomes a very difficult matter to calculate the best distribution of heating load. There are 6 Russian references.

B

TITLE: Two-liquid hydrostatic differential altimeter

SOURCE: Izmeritel'naya tekhnika, no. 4, 1966, 83-84

TOPIC TAGS: altimeter, liquid level instrument, measuring instrument, temperature dependence

ABSTRACT: The proposed hydrostatic altimeter is based on the principle of interconnecting vessels. One liquid is poured over the other in each of the connecting vessels. When both vessels are at the same level, the heavy and light liquids are also at equal levels. When one vessel drops below the other, more of the heavy liquid is transferred to the lower vessel and the difference of the levels of the light fluid is amplified relative to that of the heavy one and serves as a sensitive measure of any tilt angle. Equations are derived for the level differential as a function of the temperature and densities of the liquids, and the measurement errors are estimated. The calculations demonstrate that a two-liquid altimeter increases the accuracy and sensitivity of the measurements and can be used in cases when small deviations from horizontality, planarity, and linearity are to be measured, such as in machine building, astronomy, geodesy, automation, erection work, and similar applications. **TITLE:** Automatic time-conductimetric analysis of a mixture of hexamethylenediamine and hexamethylenamine

**PERIODICAL:** Referativnyy zhurnal. Khimiya, no. 4, 1963, 156, abstract 43160 (Tr. po khimii i khim. tekhnol. (Gor'kiy), no. 4, 1961, 772 - 774)

**TEXT:** An automatic time-conductimetric method of analyzing a mixture of hexamethylenediamine (I) and hexamethylenamine (II) has been developed, the basic principle of which has been described in RZhKhim, 1959, no. 7, 22975. The content of II is determined by conductimetric titration of the mixture with an aqueous solution of HCl in the presence of salicyl aldehyde (III). I forms a compound with III which cannot be titrated by the acid. Titration of the mixture of I and II in the absence of III is used to determine the total content of I and II, the content of I being calculated from the difference between the two titrations. The analyzed sample ~3.5 g in weight is dissolved in water in a 100 ml measuring flask (solution A).

Card 1/2

Automatic time-conductimetric analysis...

S/081/63/000/004/010/051  
B19/B180

20 ml ethanol, 3.5 ml III, 10 ml sol. A and 40 ml water were placed in the bath of the conductimeter and titrated time-conductimetrically for 15 min with 0.05 - 0.07 N sol. HCl. The equivalence point was determined from the salient point in the potential (mv) v. time (sec) titration curve, 10 ml sol. A was transferred to a 100 ml measuring flask and water added up to the mark (sol. B). 10 ml sol. B and 40 ml water were placed in the conductimeter bath and titrated for 0.5 min with the same sol. HCl. The error of the determination was  $\leq 2.5\%$ ; the analysis took 30 - 35 min. [Abstracter's note: Complete translation.]

Abstract : Salt resistant tree and shrub species were studied in the forest plantings of Alma-Atinskaya, Kzyl-Ordinskaya and South Kazakhstanskaya Oblasts. The soils of the rayons studied were chiefly represented by sierozem soils with varying degrees of salinity. On strongly solonchak clayey sierozem soils with a salt content up to 1.350%, Cl 0.052%, sulfates 0.505%, one finds growing quite well: oleaster, honey locust, Bolle's poplar, the white poplar, the black poplar, the feather branched and cork elms, and the white acacia.

"The Use of Formalin in the Treatment of Foot-and-Mouth Disease," B.A. Nemtsov  
Veterinariya, Vol 29, No 12, pp 29, 30

Advocates the application of a 0.5 to 1% sol of Formalin by means of a rubber  
bulb glass syringe to the oral cavity of an infected animal. Describes the  
procedure. Asserts that this method destroys the virus secreted with the saliva  
with beneficial effects on the over-all treatment.
